AirPatrol Demonstrates Its Technology Products at Secure Strategy Group's 'Solutions Center' Launch

*AirPatrol Showcases Security Software Industry's
Only Intrusion Detection System for Temporary Wireless Deployments*

Columbia, MD—June 2, 2010—AirPatrol Corporation, a leading wireless threat management solutions company, recently demonstrated its innovative **Rapid Deployment Sensor** (RDS) to technology executives and investors from dozens of companies on May 26 during the launch of the **Secure Strategy Group's** 'Solutions Center.' The RDS is the wireless security industry's first and only wireless intrusion detection system designed for temporary wireless security deployments, wireless vulnerability assessments and white hat penetration tests. The demonstration took place at The Center for Innovative Technology in Herndon, VA.

"The RDS provides security personnel in global 1000 companies, blue-chip corporations, government agencies, law enforcement and correctional industries with a rapid and cost-effective way to evaluate strengths and weaknesses in their wireless environments," said Ozzie Diaz, CEO, AirPatrol Corporation. "Guaranteeing unimpeded network security is the biggest challenge facing corporations today and with a more mobile workforce the threats to protecting proprietary data are magnified and penalties and long term ramifications and vulnerabilities are real. Corporations need to act now."

The RDS is ideal in temporary wireless environments, such as a corporation's quarterly financial investor meetings, correctional facilities where the acquisition of contraband cell phones is a problem and temporary military posts in the field of battle.

The RDS is used with AirPatrol's Wireless Locator System (WLS), the only wireless intrusion detection and location system for managing both 802.11 WLAN Device and Cellular Device security. The RDS is a standard WLS Sensor, a wireless mesh backhaul and a rechargeable battery packaged in a compact, rugged, weatherproof case. The RDS's built-in wireless mesh node eliminates the need for network cabling between sensors. Network connectivity between the WLS Sensors and the laptop hosting the WLS Management application is achieved through the 802.11-based wireless mesh. RDS's easy set-up, rugged case, and battery-powered operation make it an ideal solution to rapid deployment security requirements.
